The Role of Continuous Glucose Monitors (CGM) in Diabetes Management

What is a CGM?
CGM systems measure glucose levels continuously, displaying a glucose level every 1-5 minutes along with trend arrows to indicate the rate and direction of glucose change.

CGM system components:
- Sense glucose in interstitial fluid through a thin, flexible, sensor inserted under the skin and adhered to the skin with adhesive.
- Transmit sensor glucose information to a display device, which can include a wireless handheld device, smartphone application or a compatible insulin pump.

Benefits of CGM compared to Blood Glucose Monitoring (BGM)

How Can CGM Improve Diabetes Management?

Glucose trend information provides valuable context that helps the person with diabetes make proactive treatment decisions to mitigate hypoglycemia and hyperglycemia.

CGM reports synthesize large amounts of glucose data (up to 1440 glucose values per day) into reports and graphs, providing insights into glucose patterns.
Who is a good candidate for CGM?

Any person with diabetes who:

- Requires insulin for treatment of their diabetes
- Can tolerate the CGM adhesive and is willing to wear an on-body device
- Desires more comprehensive information about their glucose values and trends
- Is at risk for severe hypoglycemia or has hypoglycemia unawareness

CJM Across the Lifespan

The Role of Continuous Glucose Monitors (CGM) in Diabetes Management

How can I help ensure success with CGM?
Address the most common problems

**Problem:** Skin irritation from the CGM adhesive

**Solutions:** Use the following tips to prevent skin reaction and promote skin health.9

✅ Insert the sensor in a site approved by manufacturer and in an area with enough fat to “pinch” up.

✅ Clean the insertion site and allow to thoroughly dry.

✅ Avoid inserting sensors in areas with broken skin, such as cuts or scabs, or areas where skin creases with bending, like the waistline.

✅ Rotate sensor insertion sites to a different location with each change to give skin time to heal.

✅ The user should remove the device and not continue using the device if skin irritation continues to occur.

✅ Use a liquid barrier product to reduce skin exposure to CGM adhesive if skin irritation occurs.

**Problem:** Alarm and alert fatigue

**Solutions:** Use personalized CGM alert settings.10

✅ Users may not need to program all CGM alerts.

✅ If alert frequency is burdensome to the user, consider setting only the hypoglycemia threshold alert and disabling all other alerts.

✅ Ensure alerts are actionable and align with the individual’s goals for using CGM.

**Problem:** Information overload—being overwhelmed by the data

**Solutions:** Use these tips to systematically review the data.11

✅ Focus on one actionable pattern at a time.

✅ Deal with hypoglycemia first.

✅ Set reasonable expectations (example: glucose levels are supposed to rise after meals).

✅ Focus on big picture, not on a particular day.
